disease:Defects in MC2R are the cause of glucocorticoid deficiency type (GCCD1) [MIM:202200]; also known as familial glucocorticoid deficiency (FGD1). GCCD1 is an autosomal recessive disorder due to congenital insensitivity or resistance to adrenocorticotropin (ACTH). It is characterize progressive primary adrenal insufficiency, without mineralocorticoid deficiency.,function:Receptor for ACTH. This receptor is mediated by G p (G(s)) which activate adenylate cyclase.,similarity:Belongs to the G-prote coupled receptor 1 family.,subunit:Interacts with FALP/MRAP.,tissue specificity:Melanocytes and corticoadrenal tissue.,

Background	MC2R encodes one member of the five-member G-protein associated melanocortin receptor family. Melanocortins (melanocyte-stimulating hormones and adrenocorticotropic hormone) are peptides derived from pro-opiomelanocortin (POMC). MC2R is selectively activated by adrenocorticotropic hormone, whereas the other four melanocortin receptors recognize a variety of melanocortin ligands. Mutations in MC2R can result in familial glucocorticoid deficiency. Alternate transcript variants have been found for this gene. [provided by RefSeq, May 2014],
