Tissue Specificity	Highly expressed in T and B-cells, as well as natural killer and mature dendritic cells. Expressed at higher levels in Th1 as compared to Th2 cells. Expressed at low levels in all normal tissues tested, including lung, testis, small intestine, breast, liver and placenta.
Function	alternative products:A number of isoforms may be produced,polymorphism:Variation in PHF11 seems to be associated with propensity to atopy and asthma.,similarity:Contains 1 PHD-type zinc finger.,subunit:Interacts with BRCA1.,tissue specificity:Expressed in all normal tissues tested, including lung, testis, small intestine, breast, liver and placenta.,
Background	This gene encodes a protein containing a PHD (plant homeodomain) type zinc finger. This gene has been identified in some studies as a candidate gene for asthma. Naturally-occurring readthrough transcription may occur from the upstream SETDB2 (SET domain bifurcated 2) gene to this locus. Alternative

	splicing results in multiple transcript variants. [provided by RefSeq, Mar 2016],
