Cell Pathway	Cell membrane ; Single-pass type I membrane protein .
Tissue Specificity	Isoform 1: Expressed mainly in differentiated cells (at protein level). Isoform 2: Expressed mainly in undifferentiated cells (at protein level).
Function	function:Induces a hyperpolarization-activated chloride current when expressed in Xenopus oocytes. May be a modulator capable of activating endogenous oocyte channels.,miscellaneous:Marker of a cell type preferentially transformed by neu or ras oncoprotein.,similarity:Belongs to the FXYD family.,tissue specificity:Expressed in a subset of human breast tumors.,
Background	This gene belongs to a small family of FXYD-domain containing regulators of Na ⁺ /K ⁺ ATPases which share a 35-amino acid signature sequence domain, beginning with the sequence PFXYD, and containing 7 invariant and 6 highly conserved amino acids. This gene encodes a cell membrane protein that may regulate the function of ion-pumps and ion-channels. This gene may also play a role in tumor progression. Alternative splicing results in multiple transcript variants
